1. Python basics

I use by guide the sintaxis equivalence fortran functions.

For use only the keyboard remember	`Tab` and `Shift + Tab`
Change tabs in VSCode	`alt+'number-of-the-tab'`
Open terminal	`Wind + º`
Enter in mode Mu o IDLE for phyton 3	`python3 -v`
Compile and execute file of python	`python3 namefile.py`

Cuadro 1: Descripción

1.1. Short ideas

In python only exist two types of numbers variables the integers and the floating-point numbers.

`Win + Space` for change the keyboard distro.

The `input()` in python acepted all type of variable do you write

Exit fullscreen mode of VSCode with `F11`

Cuadro 2: Puntual notes

2. Flow control

2.1. Short ideas

Cuadro 4: Puntual notes

```
1    if variable1 == equivalence-condition1
2       Order to do if is true the equivalence.
3    elif variable2 ==  equivalence-condition2
4       Order to do if is true the equivalence.
5    elif variable3 == equivalence-condition3
6       Order to do if is true the equivalence.
7    more & more conditionals...
8  #optional the sintaxis end with a final else
9    else:
10      Order to do if is false the previous equivalences.
```

Listing 1: If, else, 'elif is equal else if' sintaxis of basics conditionals.
